# TRIANGULATING POINT SETS

## DEFINITION

A triangulation of A set  $P$  of  $n$  points in the plane is a graph having  $P$  as set of vertices which is rectilinear, planar, and maximal in the number of edges.

# TRIANGULATING POINT SETS

## DEFINITION

A triangulation of A set  $P$  of  $n$  points in the plane is a graph having  $P$  as set of vertices which is rectilinear, planar, and maximal in the number of edges.

# TRIANGULATING POINT SETS

## DEFINITION

A triangulation of A set  $P$  of  $n$  points in the plane is a graph having  $P$  as set of vertices which is rectilinear, planar, and maximal in the number of edges.

# TRIANGULATING POINT SETS

## DEFINITION

A triangulation of A set  $P$  of  $n$  points in the plane is a graph having  $P$  as set of vertices which is rectilinear, planar, and maximal in the number of edges.

**Corollary.** All the faces of such a graph are triangles, except for the unbounded one, which is the exterior of the convex hull of  $P$ .

# TRIANGULATING POINT SETS

## DEFINITION

A triangulation of a set  $P$  of  $n$  points in the plane is a graph having  $P$  as set of vertices which is rectilinear, planar, and maximal in the number of edges.

**Corollary.** All the faces of such a graph are triangles, except for the unbounded one, which is the exterior of the convex hull of  $P$ .

## COMPLEXITY

Every triangulation of any set  $P$  of  $n$  points has:

$$2n - h - 2 \text{ triangles}$$

$$3n - h - 3 \text{ edges}$$

where  $h$  is the number of vertices of  $ch(P)$ .

# TRIANGULATING POINT SETS

## DEFINITION

A triangulation of a set  $P$  of  $n$  points in the plane is a graph having  $P$  as set of vertices which is rectilinear, planar, and maximal in the number of edges.

**Corollary.** All the faces of such a graph are triangles, except for the unbounded one, which is the exterior of the convex hull of  $P$ .

## COMPLEXITY

Every triangulation of any set  $P$  of  $n$  points has:

$$2n - h - 2 \text{ triangles}$$

$$3n - h - 3 \text{ edges}$$

where  $h$  is the number of vertices of  $ch(P)$ .

*Proof.* Each triangle has exactly 3 edges. Each internal edge belongs to exactly 2 triangles. Each external edge belongs to exactly 1 triangle. Therefore,  $3t = 2(e - h) + h = 2e - h$ . According to Euler's formula:  $n + (t + 1) = v + f = e + 2$ .

Combining both equations:

$$e = n + t - 1 \Rightarrow 3e = 3n + 3t - 3 = 3n + 2e - h - 3 \Rightarrow e = 3n - h - 3$$

$$3t = 2e - h = 6n - 2h - 6 - h = 6n - 3h - 6 \Rightarrow t = 2n - h - 2$$

# TRIANGULATING POINT SETS

## DEFINITION

A triangulation of a set  $P$  of  $n$  points in the plane is a graph having  $P$  as set of vertices which is rectilinear, planar, and maximal in the number of edges.

**Corollary.** All the faces of such a graph are triangles, except for the unbounded one, which is the exterior of the convex hull of  $P$ .

## COMPLEXITY

Every triangulation of any set  $P$  of  $n$  points has:

$$2n - h - 2 \text{ triangles}$$

$$3n - h - 3 \text{ edges}$$

where  $h$  is the number of vertices of  $ch(P)$ .

## DEGENERACIES

As you may have noticed, we are assuming that the set  $P$  does not contain three or more points on a line. The assumption holds along the entire chapter.

# TRIANGULATING POINT SETS

## DATA STRUCTURE

We want to answer the most usual questions for any *decomposition of the plane*:

- For any given triangle, report its edges/vertices.
- For any given vertex, report the sorted list of edges/triangles incident to it.
- For any given edge, report its endpoints and its adjacent triangles.

# TRIANGULATING POINT SETS

## DATA STRUCTURE

We want to answer the most usual questions for any *decomposition of the plane*:

- For any given triangle, report its edges/vertices.
- For any given vertex, report the sorted list of edges/triangles incident to it.
- For any given edge, report its endpoints and its adjacent triangles.

The appropriate structure is, once again, a **DCEL**:

## LOWER BOUND

This problem has an  $\Omega(n \log n)$  lower bound, since the convex hull of the set of points can be trivially obtained in  $O(n)$  time from the triangulation.

## A TOOL FOR INTERPOLATION

# DELAUNAY TRIANGULATION

## A TOOL FOR INTERPOLATION

### Motivation

Triangulations give a natural way to interpolate! For many interpolation applications, it makes more sense to interpolate from points that are nearby than from points that are far away

To do that, the shape of the triangles matters:

- Long and skinny triangles produce interpolation from points that are far
- Equilateral-like triangles tend to give interpolations from points closer and well distributed

# DELAUNAY TRIANGULATION

## DEFINITION AND PROPERTIES

# DELAUNAY TRIANGULATION

## DEFINITION AND PROPERTIES

### Definition

Given a set  $P$  with  $n$  points in the plane...

# DELAUNAY TRIANGULATION

## DEFINITION AND PROPERTIES

### Definition

Given a set  $P$  of  $n$  points in the plane, the **Delaunay triangulation** of  $P$ ,  $Del(P)$ , is a triangulation where all triangles are *Delaunay triangles*.

Three points  $p_i, p_j, p_k$  form a *Delaunay triangle* (in general, are vertices of a face) if and only if the circle through them does not contain any point of  $P$  in its interior.

# DELAUNAY TRIANGULATION

## DEFINITION AND PROPERTIES

### Definition

Given a set  $P$  of  $n$  points in the plane, the **Delaunay triangulation** of  $P$ ,  $Del(P)$ , is a triangulation where all triangles are *Delaunay triangles*.

Three points  $p_i, p_j, p_k$  form a *Delaunay triangle* (in general, are vertices of a face) if and only if the circle through them does not contain any point of  $P$  in its interior.

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND 3D CONVEX HULL

### Theorem

Let  $P = \{p_1, \dots, p_n\}$  with  $p_i = (a_i, b_i, 0)$ . Let  $p_i^* = (a_i, b_i, a_i^2 + b_i^2)$  be the vertical projection of each point  $p_i$  onto the paraboloid  $z = x^2 + y^2$ . Then  $Del(P)$  is the orthogonal projection onto the plane  $z = 0$  of the lower convex hull of  $P^*$ .

$p_i^*, p_j^*, p_k^*$  form a (triangular) face of the lower convex hull of  $P^*$

The plane through  $p_i^*, p_j^*, p_k^*$  leaves all the remaining points of  $P^*$  above it

The circle through  $p_i, p_j, p_k$  leaves all the remaining points of  $P$  in its exterior

DELAUNAY TRIANGULATION AND EQUIANGULARITY

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND EQUIANGULARITY

Among all the triangulations of  $P$ , the Delaunay triangulation maximizes the minimum angle (the angles of  $Del(P)$  are less acute).

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND EQUIANGULARITY

Among all the triangulations of  $P$ , the Delaunay triangulation maximizes the minimum angle (the angles of  $Del(P)$  are less acute).

Let us be more precise:

If  $\mathcal{T} = \{T_1, \dots, T_t\}$  is a triangulation of  $P$ , the **fineness** (a.k.a., *angle vector*) of  $\mathcal{T}$  is the increasingly sorted list of the angles of all the triangles  $T_i$  of  $\mathcal{T}$ :  $F(\mathcal{T}) = (\alpha_1, \dots, \alpha_{3t})$ .

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND EQUIANGULARITY

Among all the triangulations of  $P$ , the Delaunay triangulation maximizes the minimum angle (the angles of  $Del(P)$  are less acute).

Let us be more precise:

If  $\mathcal{T} = \{T_1, \dots, T_t\}$  is a triangulation of  $P$ , the **fineness** (a.k.a., *angle vector*) of  $\mathcal{T}$  is the increasingly sorted list of the angles of all the triangles  $T_i$  of  $\mathcal{T}$ :  $F(\mathcal{T}) = (\alpha_1, \dots, \alpha_{3t})$ .

Since every triangulation of  $P$  has  $t = 2n - h - 2$  triangles, these  $3t$ -tuples can be compared and lexicographically sorted.

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND EQUIANGULARITY

Among all the triangulations of  $P$ , the Delaunay triangulation maximizes the minimum angle (the angles of  $Del(P)$  are less acute).

Let us be more precise:

If  $\mathcal{T} = \{T_1, \dots, T_t\}$  is a triangulation of  $P$ , the **fineness** (a.k.a., *angle vector*) of  $\mathcal{T}$  is the increasingly sorted list of the angles of all the triangles  $T_i$  of  $\mathcal{T}$ :  $F(\mathcal{T}) = (\alpha_1, \dots, \alpha_{3t})$ .

Since every triangulation of  $P$  has  $t = 2n - h - 2$  triangles, these  $3t$ -tuples can be compared and lexicographically sorted.

The Delaunay triangulation maximizes the fineness:

$$F(Del(P)) \geq F(\mathcal{T}), \quad \forall \mathcal{T} \text{ triangulation of } P.$$

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND EQUIANGULARITY

Among all the triangulations of  $P$ , the Delaunay triangulation maximizes the minimum angle (the angles of  $Del(P)$  are less acute).

Let us be more precise:

If  $\mathcal{T} = \{T_1, \dots, T_t\}$  is a triangulation of  $P$ , the **fineness** (a.k.a., *angle vector*) of  $\mathcal{T}$  is the increasingly sorted list of the angles of all the triangles  $T_i$  of  $\mathcal{T}$ :  $F(\mathcal{T}) = (\alpha_1, \dots, \alpha_{3t})$ .

Since every triangulation of  $P$  has  $t = 2n - h - 2$  triangles, these  $3t$ -tuples can be compared and lexicographically sorted.

The Delaunay triangulation maximizes the fineness:

$$F(Del(P)) \geq F(\mathcal{T}), \quad \forall \mathcal{T} \text{ triangulation of } P.$$

The proof of this statement requires a last lemma.

# DELAUNAY TRIANGULATION

$\Rightarrow$ ) If  $\epsilon > \epsilon'$ , then  $d \in \text{ext}(C_{abc})$

$\Leftarrow$ ) If  $d \in \text{ext}(C_{abc})$ , then  $\epsilon > \epsilon'$

If  $\epsilon = \beta$ , then  $\epsilon = \beta > \beta_1 \geq \epsilon'$

If  $\epsilon = \delta$ , then  $\epsilon = \delta > \delta_1 \geq \epsilon'$

If  $\epsilon = \alpha_1$ , then  $\epsilon = \alpha_1 = \overline{\alpha_1} > \delta_2 \geq \epsilon'$

If  $\epsilon = \alpha_2$ , then  $\epsilon = \alpha_2 = \overline{\alpha_2} > \beta_2 \geq \epsilon'$

If  $\epsilon = \gamma_1$ , then  $\epsilon = \gamma_1 = \overline{\gamma_1} > \delta_1 \geq \epsilon'$

If  $\epsilon = \gamma_2$ , then  $\epsilon = \gamma_2 = \overline{\gamma_2} > \beta_1 \geq \epsilon'$

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND EQUIANGULARITY

**Corollary.** The Delaunay triangulation is the most equiangular among all triangulations of a given set of points.

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND EQUIANGULARITY

**Corollary.** The Delaunay triangulation is the most equiangular among all triangulations of a given set of points.

If  $P$  does not contain four or more concyclic points, it follows from the previous lemma.

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND EQUIANGULARITY

**Corollary.** The Delaunay triangulation is the most equiangular among all triangulations of a given set of points.

If  $P$  does not contain four or more concyclic points, it follows from the previous lemma.

If  $P$  contains four or more concyclic points,  $Del(P)$  contains a polygon inscribed in a circle which can be triangulated in several ways. Nevertheless, Lemma 1 (on the geometrical locus of all the points from which a segment is seen under a given angle) guarantees that every triangulation of a polygon inscribed in a circle has the same fineness, since each edge of the polygon belongs to a triangle, and every possible triangle gives rise to the same angle.

## DELAUNAY TRIANGULATION AND OPTIMAL TRIANGULATIONS

The Delaunay triangulation is optimal for many criteria!

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND OPTIMAL TRIANGULATIONS

The Delaunay triangulation is optimal for many criteria!

- Maximizes the minimum angle
- Maximizes the whole angle vector

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND OPTIMAL TRIANGULATIONS

The Delaunay triangulation is optimal for many criteria!

- Maximizes the minimum angle
- Maximizes the whole angle vector
- Minimizes the maximum circumcircle

## DELAUNAY TRIANGULATION AND OPTIMAL TRIANGULATIONS

The Delaunay triangulation is optimal for many criteria!

- Maximizes the minimum angle
- Maximizes the whole angle vector
- Minimizes the maximum circumcircle
  
- Minimizes the maximum circumscribed circle

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND OPTIMAL TRIANGULATIONS

The Delaunay triangulation is optimal for many criteria!

- Maximizes the minimum angle
- Maximizes the whole angle vector
- Minimizes the maximum circumcircle
  
- Minimizes the maximum circumscribed circle
- Maximizes the sum of the inradii

# DELAUNAY TRIANGULATION

## DELAUNAY TRIANGULATION AND OPTIMAL TRIANGULATIONS

The Delaunay triangulation is optimal for many criteria!

- Maximizes the minimum angle
- Maximizes the whole angle vector
- Minimizes the maximum circumcircle
  
- Minimizes the maximum circumscribed circle
- Maximizes the sum of the inradii
- Minimizes the integral of the gradient squared (for terrains!)

This is known as the *roughness* of the terrain

Note that this property is independent from the data, in other words, it is independent from the values of the  $z$ -coordinates of the input points!
