Algorithmic Geometry

Discrete and
Combinatorial Geometry

DAG: Discrete and Algorithmic Geometry

One course about two (related) topics

Algorithmic Geometry

Discrete and
Combinatorial Geometry

Geometric objects

DAG: Discrete and Algorithmic Geometry

One course about two (related) topics

Algorithmic Geometry

design of algorithms that deal with
geometric objects

Discrete and Combinatorial Geometry

study of combinatorial properties of
geometric objects

Geometric objects

DAG: Discrete and Algorithmic Geometry

A course with two parts

Algorithmic Geometry

design of algorithms that deal with
geometric objects

Discrete and Combinatorial Geometry

study of combinatorial properties of
geometric objects

DAG: Discrete and Algorithmic Geometry

A course with two parts

Algorithmic Geometry

design of algorithms that deal with
geometric objects

Part I

Discrete and Combinatorial Geometry

study of combinatorial properties of
geometric objects

Part II

DAG: Discrete and Algorithmic Geometry

A course with two parts

Algorithmic Geometry

design of algorithms that deal with
geometric objects

Part I

Instructor:
Rodrigo Silveira

Discrete and Combinatorial Geometry

study of combinatorial properties of
geometric objects

Part II

Instructor:
Clemens Huemer

to solve geometric problems

- Keep in mind: *Algorithmic geometry*, as a field, is more well-known as *Computational Geometry*

DAG: Discrete and Algorithmic Geometry

Introduction to algorithmic geometry

Goal: design and analysis of efficient algorithms
to solve geometric problems

- Keep in mind: *Algorithmic geometry*, as a field, is more well-known as *Computational Geometry*

Let's take a look at some examples of applied geometric problems

Applications of Algorithmic Geometry

AIR TRAFFIC CONTROL

Detect the pair of airplanes that are in most imminent danger of collision among those who show up on the screen of an air controller

What are the geometric objects here?

Applications of Algorithmic Geometry

ROAD NAVIGATION (with GPS)

Applications of Algorithmic Geometry

ROAD NAVIGATION (with GPS)

How does your GPS navigator know which objects (streets, places of interest, etc.) to show?

Applications of Algorithmic Geometry

ROAD NAVIGATION (with GPS)

How does your GPS navigator know which objects (streets, places of interest, etc.) to show?

Applications of Algorithmic Geometry

ROAD NAVIGATION (with GPS)

How does your GPS navigator know which objects (streets, places of interest, etc.) to show?

Applications of Algorithmic Geometry

ROAD NAVIGATION (with GPS)

How does your GPS navigator know which objects (streets, places of interest, etc.) to show?

This geometric problem is called *windowing*

Applications of Algorithmic Geometry

ROAD NAVIGATION (with GPS)

How does it compute the best way to get from one place to another?

This is a type of geometric *shortest path problem*

Applications of Algorithmic Geometry

TOPOGRAPHICAL DATA INTERPOLATION

From the altitude data of a sample of points in a terrain, obtaining an approximation of the terrain as a continuous function, by interpolating the values of the altitude of the remaining points

Applications of Algorithmic Geometry

TOPOGRAPHICAL DATA INTERPOLATION

From the altitude data of a sample of points in a terrain, obtaining an approximation of the terrain as a continuous function, by interpolating the values of the altitude of the remaining points

Applications of Algorithmic Geometry

GRAPHICS: HIDING NON-VISIBLE PORTIONS OF A SCENE

Represent a realistic scene, by showing on the screen only the portions of the scene which are visible from the viewpoint

Applications of Algorithmic Geometry

ROBOTICS: MOTION PLANNING PROBLEM

Find the shortest path between two points, avoiding obstacles

Applications of Algorithmic Geometry

ROBOTICS: MOTION PLANNING PROBLEM

Find the shortest path between two points, avoiding obstacles

Applications of Algorithmic Geometry

ROBOTICS: MOTION PLANNING PROBLEM

Find the shortest path between two points, avoiding obstacles

Applications of Algorithmic Geometry

ROBOTICS: MOTION PLANNING PROBLEM

Find the shortest path between two points, avoiding obstacles

Scout, Amazon's self-driving delivery robot

Applications of Algorithmic Geometry

ROBOTICS: MOTION PLANNING PROBLEM

Find the shortest path between two points, avoiding obstacles

Scout, Amazon's

Applications of Algorithmic Geometry

ROBOTICS: MOTION PLANNING PROBLEM

Find the shortest path between two points, avoiding obstacles

Scout, Amazon's

Applications of Algorithmic Geometry

CAD and CAM: MODELING OBJECTS

Design geometric objects by an appropriate discretization. Store the geometric information in a structured and efficient way

Applications of Algorithmic Geometry

COLLISION DETECTION

Detect whether or not the intersection of two objects in the plane or in 3D space is empty

Applications of Algorithmic Geometry

COLLISION DETECTION

Detect whether or not the intersection of two objects in the plane or in 3D space is empty

Applications of Algorithmic Geometry

PACKING

Given a set of objects (luggage), decide whether or not it is possible to pack them in a given space (trunk) and, in the affirmative, compute how this can be done

Applications of Algorithmic Geometry

FIELDS OF APPLICATION

- Computer Graphics: realistic visualization, modelling, ...
- Automated processes: computer vision, voice recognition, automatic reading, robotics, ...
- Geographics information systems, air traffic control
- Design and manufacturing
- 3D reconstruction from 2D information
- Molecular biology
- Astrophysics
- VLSI
- Statistics, operations research
- ...

Introduction to Algorithmic Geometry

Geometric problems

The problems posed in the previous applications have some elements in common:

- Geometric nature of the information
- The geometric problem is discrete
- Big amount of data: requires efficient solutions (in time and space)

Introduction to Algorithmic Geometry

Geometric problems

The problems posed in the previous applications have some elements in common:

- Geometric nature of the information
- The geometric problem is discrete
- Big amount of data: requires efficient solutions (in time and space)

Algorithmic Geometry: design and analysis of efficient algorithms to solve geometric problems

Introduction to Algorithmic Geometry

Geometric problems

The problems posed in the previous applications have some elements in common:

- Geometric nature of the information
- The geometric problem is discrete
- Big amount of data: requires efficient solutions (in time and space)

Algorithmic Geometry: design and analysis of efficient algorithms to solve geometric problems

Typical steps in solving a geometric problem

- Analyze the problem and understand its geometric component
- Discretize the problem (if it is not discrete)
- Exploit the geometric characteristics of the problem
- Find efficient algorithms
- Store in appropriate data structures

Introduction to Algorithmic Geometry

Example of a *clean* geometric problem

Introduction to Algorithmic Geometry

Example of a *clean* geometric problem

Given n points in the plane (e.g., villages) find the optimal location of a service to attend this population (antenna, hospital, supermarket,...).

Introduction to Algorithmic Geometry

Example of a *clean* geometric problem

Given n points in the plane (e.g., villages) find the optimal location of a service to attend this population (antenna, hospital, supermarket,...).

Given $(x_1, y_1), \dots, (x_n, y_n)$, find (x, y) achieving $\min_{(x,y) \in \mathbb{R}^2} \max_{i=1 \dots n} (x - x_i)^2 + (y - y_i)^2$.

Introduction to Algorithmic Geometry

Example of a *clean* geometric problem

Given n points in the plane (e.g., villages) find the optimal location of a service to attend this population (antenna, hospital, supermarket,...).

Given $(x_1, y_1), \dots, (x_n, y_n)$, find (x, y) achieving $\min_{(x,y) \in \mathbb{R}^2} \max_{i=1 \dots n} (x - x_i)^2 + (y - y_i)^2$.

Introduction to Algorithmic Geometry

Example of a *clean* geometric problem

Given n points in the plane (e.g., villages) find the optimal location of a service to attend this population (antenna, hospital, supermarket,...).

Given $(x_1, y_1), \dots, (x_n, y_n)$, find (x, y) achieving $\min_{(x,y) \in \mathbb{R}^2} \max_{i=1 \dots n} (x - x_i)^2 + (y - y_i)^2$.

Introduction to Algorithmic Geometry

Example of a *clean* geometric problem

Given n points in the plane (e.g., villages) find the optimal location of a service to attend this population (antenna, hospital, supermarket,...).

Given $(x_1, y_1), \dots, (x_n, y_n)$, find (x, y) achieving $\min_{(x,y) \in \mathbb{R}^2} \max_{i=1 \dots n} (x - x_i)^2 + (y - y_i)^2$.

This problem is difficult to solve using analytical techniques.

But it can be discretized.

This allows an algorithmic solution.

The cost of the algorithm depends upon the number of input points.

Introduction to Algorithmic Geometry

A brief history of computational geometry

Name initially used in different contexts

- In Minsky's book "Perceptrons" (1969) it meant pattern recognition.
- In Forrest paper (1971) it meant curves and surfaces for geometric modeling.
- Shamos' PhD Thesis "Computational geometry" (1975) uses the name for the first time as we understand it today:

Design and analysis of efficient algorithms to solve geometric problems.

Better names are possible (and are sometimes used, like in this course!)

- Algorithmic geometry
- Geometric algorithms

Introduction to Algorithmic Geometry

A brief history of computational geometry

How it started

- Geometric algorithms have been around for a while
 - Euclid constructions in The Elements (300 BC)
 - Descartes Cartesian geometry (17th century)
- Computers brought renewed interest
 - 50's first graphics program (for hidden line removal)
 - First CAD (Computer-aided design) programs
- ... and modified its characteristics
 - massive amount of data
 - need of efficiency

Introduction to Algorithmic Geometry

A brief history of computational geometry

Some early milestones

- 1975: Michael Shamos' PhD thesis *Problems in Computational Geometry*.
- 1975-1985: Increasing interest. Most basic algorithms date from this period.
- 1983: First European Workshop on Computational Geometry
- 1985: First Annual Symposium on Computational Geometry
Also: first textbook (today, more than 5)
- 1996: CGAL: first serious implementation of a robust geometric algorithms library
- 1997: First handbook on the topic (second in 2000)

Introduction to Algorithmic Geometry

A brief history of computational geometry

Today

- Recognized discipline within *Theoretical Computer Science* and *Discrete Mathematics*
- “Large” active community. Many research groups in the USA, Canada, Europe, México, Australia, ...
In Spain: Barcelona, Sevilla, Santander, Alcalá, Zaragoza, Girona, ...
- 5 specialized journals devoted to it
- 3 annual specialized conferences
- An important presence in algorithms and discrete math conferences

- 5 specialized journals devoted to it
- 3 annual specialized conferences
- An important presence in algorithms and discrete math conferences

What about *discrete and combinatorial geometry*?

- Closely related field
- Developed partially together, partially in parallel
- Share most journals, conferences, and many books

This course

Goals for Part I (algorithmic geometry)

- Know some of the main problems studied in computational geometry and its solutions, as well as its applications
- Understand the power of combining geometric tools with the suitable data structures and algorithmic paradigms
- See in action several algorithmic paradigms and data structures useful in geometric problems
- Apply geometric results to solve new problems

This course

Goals for Part I (algorithmic geometry)

- Know some of the main problems studied in computational geometry and its solutions, as well as its applications
- Understand the power of combining geometric tools with the suitable data structures and algorithmic paradigms
- See in action several algorithmic paradigms and data structures useful in geometric problems
- Apply geometric results to solve new problems

Goals for Part II (discrete and combinatorial geometry)

- Understand the combinatorial and discrete aspects of geometric problems
- Become familiar with some of the classic results in combinatorial geometry
- Know about some of the major open problems in the field

This course

Syllabus

Part I

1. Background tools
2. A basic tool (relative position)
3. Computing segment intersections
4. Convex hulls in 2D, 3D and higher dimensions
5. Convex hulls. Duality. Intersection of halfplanes. Linear programming
6. Triangulating polygons
7. Voronoi diagrams
8. Delaunay triangulations

This course

Syllabus

Part I

1. Background tools
2. A basic tool (relative position)
3. Computing segment intersections
4. Convex hulls in 2D, 3D and higher dimensions
5. Convex hulls. Duality. Intersection of halfplanes. Linear programming
6. Triangulating polygons
7. Voronoi diagrams
8. Delaunay triangulations

Part II

1. Selected theorems from discrete geometry (Helly-type, Caratheodory, and Tverberg theorems)
2. Polytopes
3. ...

This course

Methodology

- Theory lectures
- Problem sessions

This course

Methodology

- Theory lectures  by the instructor
- Problem sessions  by the students, individually
 - Part I:
 - 3 problem sessions planned
 - in each session (except for first one), one problem to be delivered and presented
 - In Part II:
 - problem presentations and paper presentations

This course

Methodology

- Theory lectures  by the instructor
- Problem sessions  by the students, individually
 - Part I:
 - 3 problem sessions planned
 - in each session (except for first one), one problem to be delivered and presented
 - In Part II:
 - problem presentations and paper presentations

Evaluation

- Course grade: 0.5 (grade of Part I) + 0.5 (grade of Part II)
- Grade of part I: 0.5 (problem 1) + 0.5 (problem 2)
- Grade of part: II 0.25 (problem) + 0.25 (paper presentation) + 0.50 (exam)
